                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        resistance to the fungal pathogen Venturia inaequalis. Vectors comprising the polynucleotides can be used to produce transgenic plants (especially apple species; resistant to fungal pathogens, especially V. inaequalis. For example, the gene sequence encoding the protein could be incorporated with the 3Ss promoter of the CaMV cauliflower mosaic virus to introduce a plant defense mechanism against the pathogen, or the promoter sequence upstream from the gene could be used in chimeric constructs to promote sequences encoding for proteins which inhibit V. inaequalis. V. inaequalis is the most severe and economically important fungal pathogen of apples, causing a disease known as scab. Sequences AAY56826-848 represent apple LRPKml LRR sequences.

                 rne invention relates to an antibody with specific affinity for a characteristic epitope of the ED-B domain of fibronectin, where the antibody has improved affinity to ED-B. The invention also relates to conjugates comprising antibodies with a suitable photoactive molecule useful in the detection and/or coagulation of blood vessels. An antibody with improved affinity to the ED-B domain is useful for diagnosis and therapy of tumours and diseases characterised by vascular proliferation, cancer, rheumatoid arthitis, neo-vasculature associated ocular disorders and psoriasis. Treatment of anglogenesis related pathologies comprises the injection of conjugates comprising antibody and a molecule capable of inducing blood coagulation and blood vessel occlusion. The present sequence is single-chain variable antibody fragment (scrv) in antibody variable limbs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               by vascular proliferation, such as diabetic retinopathy, age-related macular degeneration or tumours. The antibody localizes the respective tissue within 3 to 4 hours after injection. It is used in immunoscintigraphic detection of angiogenesis and for diagnosis and therapy of tumours and diseases characterized by vascular proliferation. The antibody can be conjugated to a molecule which induces blood coagulation and blood vessel occlusion. These conjugates are used in the preparation of injectable compositions for the treatment of angiogenesis-related pathologies, especially caused by or associated with ocular angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ScFv; single-chain variable antibody fragment; cancer; cytotox coagulant; ED-B domain; fibronectin; tumuor; coular disorder; psorias vascular proliferation; rheumatoid arthritis; blood vessel occlusion; anglogenesis; blood coagulation; variable light chain; VL.

                                                                                                                                                             AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide CC and protein sequences isolated from eucalyptus (Eucalyptus grandis) or CC pine (Pinus radiata also known as Monterey pine). The protein sequences CC are involved in cell signalling. The polynucleotide and protein cCC sequences can be used to modify the response of plant cells to external CC signals e.g. environmental changes or pathogens during the growth and CC development of a plant. They can be used to modify cell proliferation, CC differentiation, elongation and survival, resistance to disease and CC nutrient metabolism. Examples of modifications which can be produced are CC altered fruit ripening and senescence of leaves and flowers e.g. to CC delay senescence and prolong the life of cut flowers or enhance CC modifications can be used to delay senescence in selected cell types or CC croans providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in CC crost tree species giving long stretches of valuable knot-free clear covered to the can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

                                                                                                                                                                                                                                                                                                                                                        A AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide CC and protein sequences isolated from eucalyptus (Bucalyptus grandis) or CC pine (Pinus radiata also known as Monterey pine). The protein sequences CC are involved in cell signalling. The polynucleotide and protein CC sequences can be used to modify the response of plant cells to external CC signals e.g. environmental changes or pathogens during the growth and CC differentiation, elongation and survival, resistance to disease and CC differentiation, elongation and survival, resistance to disease and CC nutrient metabolism. Examples of modifications which can be produced are CC delay senescence and prolong the life of cut flowers or enhance CC senescence of reproductive organs to engineer sterile plants. Other CC corporations can be used to delay senescence in selected cell types or corporate tree species giving long stretches of valuable knot-free clear CC wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                         멍
and protein sequences isolated from eucalyptus (Bucalyptus grandis) or pine (Pinus radiata also known as Monterey Pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and cavelopment of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism. Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to caltered fruit ripening and senescence of cut flowers or enhance senescence of reproductive organs to engineer sterile plants. Other conceptions can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable knot-free clear wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                      Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                 δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and protein sequences isolated from eucalyptus (Eucalyptus grandis) or C pine (Pinus radiata also known as Monterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein consense can be used to modify the response of plant cells to external C signals e.g. environmental changes or pathogens during the growth and C development of a plant. They can be used to modify cell proliferation, C intrient metabolism. Examples of modifications which can be produced are C altered fruit ripening and senescence of leaves and flowers e.g. to C elay senescence and prolong the life of cut flowers or enhance C modifications can be used to delay senescence in selected cell types or corgans providing fruit and vegetables which have a longer shelf life corest tree species giving long stretches of valuable knot-free clear c wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and protein sequences isolated from eucalyptus (Eucalyptus grandis) or CC pine (Pinus radiata also known as Monterey pine). The protein sequences CC are involved in cell signalling. The polynucleotide and protein CC sequences can be used to modify the response of plant cells to external CC signals e.g. environmental changes or pathogens during the growth and CC development of a plant. They can be used to modify cell proliferation, CC differentiation, elongation and survival, resistance to disease and CC nutrient metabolism. Examples of modifications which can be produced are CC altered fruit ripening and senescence of leaves and flowers e.g. to CC delay senescence and prolong the life of cut flowers or enhance CC modifications can be used to delay senescence in selected cell types or cryans providing fruit and vegetables which have a longer shelf life CC between harvest and consumption, or to decrease branching frequency in CC crost tree species giving long stretches of valuable knot-free clear cc wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The improved antibody is used for rapid targeting markers of angiogenesis, for detecting diseases characterized by vascular proliferation, such as diabetic retinopathy, age related macular degeneration or tumours. The antibody localizes the respective tissue within 3 to 4 hours after injection. It is used in immunoscintigraphic detection of angiogenesis and for diagnosis and therapy of tumours and diseases characterized by vascular proliferation. The antibody can be conjugated to a molecule which induces blood coagulation and blood vessel occlusion. These conjugates are used in the preparation of injectable compositions for the treatment of angiogenesis-related pathologies, especially caused by or associated with ocular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a modified human scFv antibody which has specific affinity for a characteristic epitope of the ED-B domain of fibronectin. The affinity of the antibody for this epitope was improved by introducing a number of mutations in the complementarity determining region (CDR) residues located at the periphery of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fibronectin ED-B domain

cc sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic cc polypeptides. The proteins and their associated DNA sequences are used in Cc the treatment, prevention and diagnosts of medical conditions caused by Cc P. acnes. The disorders include SAPHO syndrome (synovitis, acne, Cc pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. Cc P. acnes is also involved in infections of bone, joints and the central Cc presence or absence of P. acnes in a patient comprises contacting a Cc presence or absence of P. acnes in a patient comprises contacting a Cc sample with a binding agent that binds to the proteins of the invention Cc specific for P. acnes proteins. These antibodies can be used to compregulate expression and activity of P. acnes polypeptides and ctivity of P. acnes polypeptides and contactions. The antibodies can be used as therefore treat P. acnes infections. The antibodies may also be used as contaction agents for determining P. acnes presence, for example, by Cc enzyme linked immunosorbent assay (ELISA).

Cc Note: The sequence data for this patent did not form part of the printed contaction, but was obtained in electronic format directly from WIPO at form wino intrombynibitished pot sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to polynucleotides encoding novel human CC proteins or their active domains. The polypeptides, polynucleotides and cc antibodies raised against the polypeptides are used in a method of CC treatment of a mammal and prevention of disorders caused by the aberrant CC protein expression or activity. The polypeptides can be used as CC molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the CC polypeptides are used to identify compounds which bind to the CC production of recombinant proteins, and in generating anti-sense DNA or CC target drugs to a tumour, in assays to determine biological activity, to CC raise antibodies/elicit an immune response, to determine quantitative CC protein levels, as tissue markers, and to isolate receptors or ligands. CC plypeptides of the invention may also be useful in treating platelet CC disorders, stem cell disorders, regenerating bone, cartilage, tendon, the proliferation, differentiation and survival of stem cells, as a cc contraceptive, treating osteoporosis and osteoarthritis, anaemia, CC Alzheimer's, parkinson's and Huntington's diseases, amylotrophic lateral CC sclerosis, stroke, immune deficiencies resulting from bacterial, viral or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to polynucleotides encoding novel human CC proteins or their active domains. The polypeptides, polynucleotides and cc antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as protein expression or activity. The polypeptides can be used as protein expression or activity. The polypeptides can be used as protein proteins, and in antibody production. The polypeptides are used to identify compounds which bind to the prolypeptides. Polynucleotides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or the production of recombinant proteins, and in generating anti-sense DNA or the transport of the invention can be used to car at the discrete transport of the invention are creeptors or ligands are antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. CC protein levels, as tissue markers, and to isolate receptors or ligands. CC protein levels, as tissue markers, and to isolate receptors or ligands. CC protein levels, as tissue markers, and to isolate receptors or ligands. CC protein levels, as tissue markers, and to isolate receptors or ligands. CC disorders, retem cell disorders, regenerating bone, cartilage, tendon, cc ligament and/or nerve tissue, wound healing, treating burns, promoting cc the proliferation, differentiation and survival of stem cells, as a cc ligament and/or nerve tissue, wound healing, treating burns, promoting cc contraceptive, treating osteoporosis and survival of stem cells, as a clerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, cc anti-inflammatory disease, eczema, haemophilia, thrombosis, and infection.

The present sequence represents a protein of the invention.

cc a Zea mays gene homologue for a leucine-rich repeat (LLR) containing CC disease resistance gene of the Cf-2 or Cf-9 type. These novel maize CC enhancing disease resistance in crops and transgenic plants including CC enhancing disease resistance in crops and transgenic plants including CC maize, soybean, sunflower, sorghum, canola, wheat, alfalfa, cotton, rice, barley or millet. The level of disease resistance protein is increased CC by transforming a plant cell with a recombinant expression cassette CC which comprises the disease resistance polynucleotide operably linked to a promoter, or by culturing the plant cell under plant growing conditions CC to produce a regenerated plant, or by inducing expression of the CC polynucleotide to modulate the disease resistance protein in a plant. CC for increasing resistance in a plant to disease, controlling cell death, CC and conferring resistance to herbicides. They are useful as probes or confident transcripts. They can be used for recombinant expression of the conference of antibodies, and in sense or antisense suppression of the polynucleotide in a host cell, tissue or plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions - \,
                                                                                                                                                            The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Patent No. 6359198

GENERAL INFORMATION:
APPLICANT: Strabala, Timothy
APPLICANT: Nieuwenhuizen, Niels
TITLE OF INVENTION: Compositions Isolated from Plant Cells
TITLE OF INVENTION: And Their Use in the Modification of Plant Cell Signalling
FILE REFERENCE: 11000/1020
CURRENT APPLICATION NUMBER: US/09/228,986
CURRENT FILING DATE: 1999-01-12
NUMBER OF SEQ ID NOS: 130
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 83
LENGTH: 153
TYPE: PRT
ORGANISM: Pinus radiata
                                                                                                                                                                                                                                                                                                                                                 US-09-252-991A-24232

APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: AUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.136
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 20481
LENGTH: 582
TYPE: PRT
ORGANISM: Pseudomonas aeruginosa
FRAVURE:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 88.2%;
